

Multivariable Calculus (MT-2008)

Date: March 1st, 2024

Time: 8:30 am - 9:30 am

Course Instructor(s)

Dr. Fahad Riaz, Dr. Nazish Kanwal
Ms. Fareeha Sultan, MS. Alishba, & Ms. Uzma.

Sessional-I Exam

Total Time: 1 Hour

Total Marks: 30

Total Questions: 04

Semester: SP-2024

Campus: Karachi

Dept: CS, CY, SE & AI.

Student Name	Roll No	Section	Student Signature
--------------	---------	---------	-------------------

Instructions:

1. Answer all questions on answer script . Credit will be awarded for correct content and clarity of presentation.
2. All the answers must be solved according to the sequence given in the question paper.
3. There are 4 questions and 2 pages.

CLO#2: Apply the theory to calculate the gradients, directional derivatives, arc length of curves, area of surfaces, and volume of solids. [6 marks]

Question 1

- (a) 3 points Find and sketch the domain of $f(x, y) = \sqrt{4 - x^2 - y^2} + \sqrt{1 - x^2}$.
- (b) 3 points Identify and sketch the level curves for specified values of k .

$$z = \sqrt{36 - 9x^2 - 4y^2}, \quad k = -1, 0, 6.$$

CLO#2: Apply the theory to calculate the gradients, directional derivatives, arc length of curves, area of surfaces, and volume of solids. [5 marks]

Question 2

- (a) 2 points Determine whether the limit $\lim_{(x,y) \rightarrow (0,0)} \frac{xy - y^2}{y^2 + x}$ exists. If it does find the limit, if not, explain why not?
- (b) 3 points Determine whether the function $f(x, y)$ is continuous at $(0, 0)$. Justify your answer.

$$f(x, y) = \begin{cases} \frac{2xy}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

CLO#2: Apply the theory to calculate the gradients, directional derivatives, arc length of curves, area of surfaces, and volume of solids. [10 marks]

Question 3

- (a) 3 points Let $z = \ln(e^x + e^y)$ be the function whose all second order partial derivatives are exist. Show that

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} = 0.$$

- (b) 3 points Let $f_x(3, 2) = 12.2$, $f_x(3, 2.2) = 16.8$ & $f_x(3, 1.8) = 7.5$. Estimate the value of $f_{xy}(3, 2)$.
- (c) 4 points The length a of a side of a triangle is increasing at a rate of 3 inch/sec, the length b of another side is decreasing at a rate of 2 inch/sec, and the contained angle θ is increasing at a rate of 0.05 radian/sec. How fast is the area $A = \frac{1}{2}ab \sin \theta$ of the triangle changing with time when $a = 40$ inch, $b = 50$ inch, and $\theta = \pi/6$.

Question 4

- (a) 5 points Find the local linear approximation of the function $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ at the point $P(3, 2, 6)$ and use it to approximate at point $Q(3.26, 1.97, 5.99)$. Compare your result with the actual value of the distance between the given points.
- (b) 3 points Use implicit differentiation to find $\frac{\partial z}{\partial x}$ at the given point (where $f(x, y, z) = 0$ defines z implicitly).

$$xe^y + ye^z + 2 \ln x - 2 - 3 \ln 2 = 0; \quad (1, \ln 2, \ln 3).$$

- (c) 1 point Determine whether the statement is true or false. Explain your answer.
If the graph of $z = f(x, y)$ is a plane in 3-space, then both f_x and f_y are constant functions.
